Water Filtration System

SALEM Stone

An Employee Owned Company

1 800-234-1982

Simple Effective Operation

- Dirty water is pumped into the static mixer and blended with a flocculent (Winflux 7418) to bind the stone particles.
- Sedimentation occurs and the solids are funneled into the cone shaped collection area at the bottom of the unit.
- A Siemens LOGO Controller operates the outlet valve to empty the collected slurry into filter bags at preset intervals.
- Water in the slurry is forced through the filter bag, by the weight of ensuing purges, retaining the solids in the bag.
